THE MOST EFFICIENT & EFFECTIVE WAY TO TRANSFORM YOUR PROPERTY!

- **Land Clearing**

The PrimeTech PT-300, a robust tracked carrier, handles large-scale vegetation, stumps, and debris, creating open, usable spaces for farming, construction, or landscaping.

The FAE SFM 250, a versatile mulcher and subsoiler, integrates with the PT-300 to grind stumps, roots, and vegetation into the soil, leaving a clean, level surface.

- **Forestry Mulching**

Dense underbrush and small trees are transformed into mulch, enriching the soil and reducing erosion while preparing the land for development or natural regeneration.

- **Fire Break Creation**

Both machines are ideal for establishing and maintaining fire breaks—wide, cleared paths that act as barriers to slow or stop the spread of wildfires.

Vegetation and debris are mulched and incorporated into the soil, reducing fire fuel loads and improving safety for the property.

- **Soil Preparation**

The SFM 250 also works as a rock crusher and soil stabilizer, breaking up rocky terrain and hard soils to prepare land for planting or construction, saving time and costs compared to traditional methods.

- **Road and Trail Building**

Both machines excel in creating or maintaining trails and access roads. They clear and stabilize paths efficiently, ensuring durable surfaces for vehicles and pedestrians.

- **Sustainable and Cost-Effective Solutions**

With minimal disruption to the surrounding environment, these machines combine powerful performance with sustainability, reducing the need for hauling debris and external soil amendments.

The combination of these machines ensures a seamless transformation, maximizing land potential while minimizing waste and environmental impact.
